Crystal Natural White

Trial Guide

A quick start guide to trialling Crystal Natural

This document has been crafted to assist you in getting the most out of our Crystal Natural Melt & Pour soap base. By following the processing instructions and information provided here, you'll understand how to process the base and find success in producing high-quality finished soap bars with 99.9% natural, detergent-free and non-irritating claims.

Processing Instructions

Cut

- » This base may appear to be firmer to cut than our typical white bases – this is normal.
- » Gradually heat the soap base to 40°C/104°F. The base will melt transparent, but set opaque.
- » This base is Titanium Dioxide free, so you can expect finished product colours to be more vivid.

Melt

Mix

- » As this base has a lower melt point than our typical white bases, more time can be taken to work with it.
- » This base is ideal for intricate moulds as it sets firmer compared to our typical white bases.
- » Once set, the base is easier to cut into singular bars (perfect for using loaf moulds).

Pour

*Use up to 2% additives

Crystal Natural Claims

After Crystal Natural has set, you can confidently package and market your bars with the following claims:

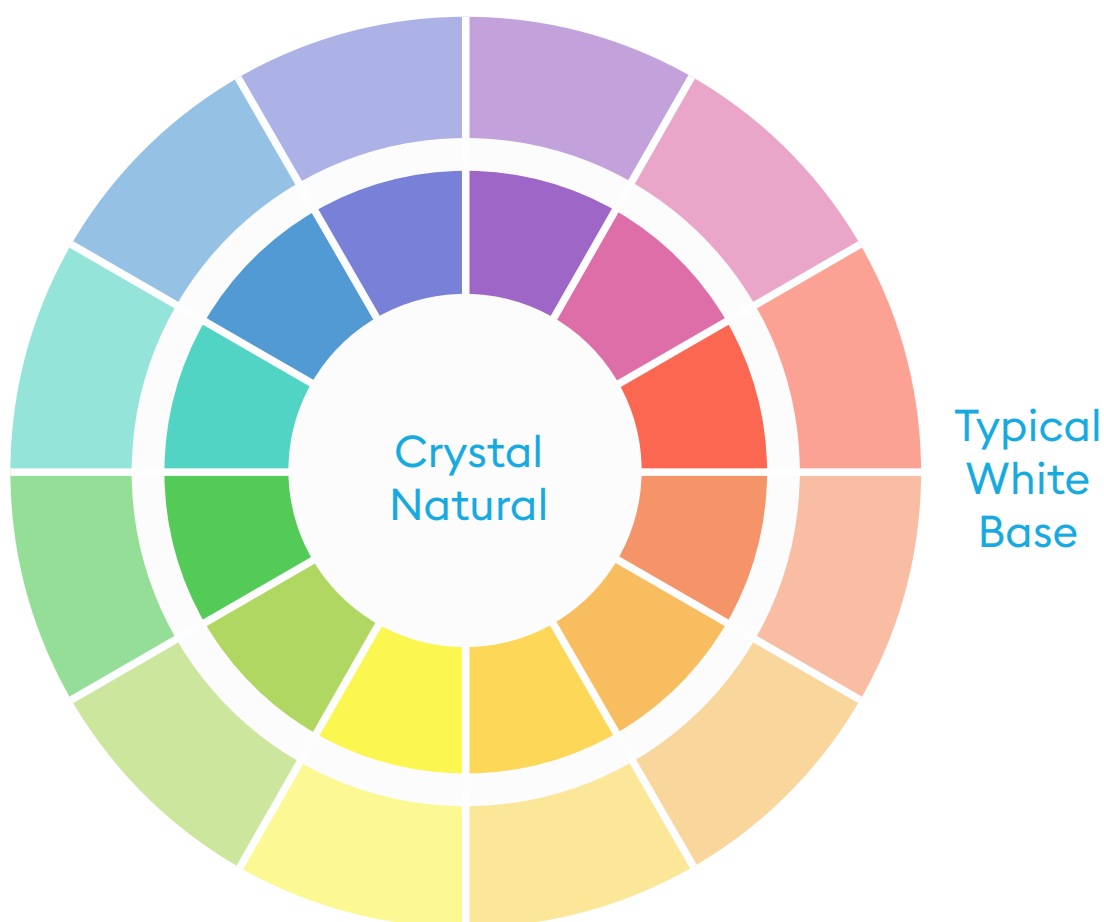

- » Detergent & Sulphate-free
- » 99.9% Natural formulation
- » Dermatologically Tested
- » Clinically Tested
- » Kind to Skin
- » Safe for skin

Colour Variation

As Crystal Natural doesn't include Titanium Dioxide in its formulation, you can expect to find some variation in colour from our typical white bases. Through our initial testing, we have found finished product colours to be more vibrant and vivid, when compared to finished product colour of other bases.

Included in this trial pack you will find two physical samples indicating the colour variation between Crystal Natural White and our other typical white bases.

Below is a colour chart indicating an example of the difference you can expect:
